

31-May

Switch statement

In switch statements, you can jump to various cases based on your expression.

Syntax:

```
switch (expression) {
```

```
    // cases
```

```
    case one:
```

```
        // do something
```

```
        break;
```

```
    case two:
```

```
        // do something
```

```
        break;
```

```
    default:
```

```
        // do something
```

```
}
```

Note:

- Cases have to be same type as expressions, must be a constant.
- duplicate case values are not allowed
- break is use to terminate the sequence
- if break is not used, it will continue to next case
- default will execute when none of above does
- if default is not at the end, put break after it.
